

Supplementary Figure S2. PRINCE selection flow and restricted association-transportability roles

A PRINCE sample-to-analysis mapping

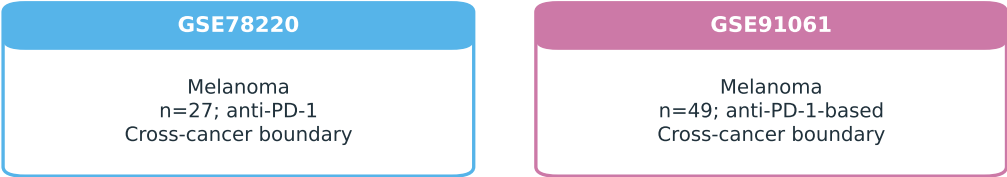

A1: 25 expression records, 20 mapped (10 R/10 NR); C2: 20 records, 18 mapped (8 R/10 NR). Only baseline tumor RNA with a known best overall response was retained; see Table S3 for descriptive included-versus-excluded comparison.

B PDAC ICI-containing cohorts have distinct evidentiary roles

C Cross-cancer cohorts are boundary analyses, not PDAC validation

Neither cohort can validate or refute the PDAC association. They test whether the score generalizes indiscriminately across cancer contexts.
